Features

FESTO

At a glance

The rotary/lifting module EHMB combines rotary and linear motion in one compact unit. The rotation is always transferred through a toothed belt to a hollow shaft by an electric motor while the linear motion is generated either by a pneumatic cylinder DSBC or an

electric cylinder ESBF. Both movements act on the output flange, which is compatible with the semi-rotary drive DRQD, so that numerous grippers can be used. Cables and tubes can be easily routed

to the front unit of the rotary/lifting module through the large hollow shaft. The movement range can also be sensed via proximity sensors at the rotary unit and the cylinder.

Advantages :

- Large hollow axis
- Stable bearing arrangement
- Various motors and cylinders enable the performance to be adapted to the application

The technology in detail

- 1 Stop nut
- 2 Grooved shaft guide
- 3 Through-hole for mounting
- 4 Mounting thread/mounting hole
- 5 Output flange with centring hole and threaded hole for payload. Interface corresponds to that of the pneumatic semi-rotary drive DRQD
- 6 Drive shaft for rotation
- 7 Cylinder retainer
- 8 Rod eye and connecting bolt for linear motion

Flexible connection

Orientation:

O= top
U= underneath
R= right
V= front
L= left
H= rear

- The rotary/lifting module EHMB can be mounted on four sides:
 - On the right or left of the housing (L, R)
 - On the front cover (V)
 - Underneath the housing (U)
- The cylinder retainer can be mounted on three sides:
 - On the right or left of the housing (L, R)
 - On the front, after removing the front cover (V)
- The side where the cylinder retainer is mounted cannot be used for mounting the rotary/lifting module.
- Either a pneumatic standards-based cylinder DSBC or an electric cylinder ESBF can be attached to the cylinder holder. (These cylinders must be ordered separately).

-  Note

Eccentric loads can destroy the bearing.
The front side (V) may be used only to attach a symmetrical applied load.

compressed air tubing. Endless rotation damages cables and tubes.

Max. inertia factor ²⁾			
for servo motor EMMS-AS/EMME-AS	45		
for stepper motor EMMS-ST	30

1) These values specify the upper limit independently of what is determined using the inertia factor.

2) The inertia factor represents the maximum controllable ratio between the inertia of the load and the intrinsic inertia of the motor with brake.

Example:

Rotary/lifting module EHMB-20 → transmission ratio $i = 4.5$

Motor EMME-AS-40-S with brake → intrinsic inertia 0.055 kgcm²

Gearbox EMGA-40-P-G3-40 → transmission ratio $i = 3$

Limit for the inertia of the load (+ intrinsic inertia) on the output side:

$$0.055 \text{ kgcm}^2 \times 45 \times 3^2 \times 4.5^2 = 451 \text{ kgcm}^2$$
